

AMENDMENTS TO CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (previously presented) A beverage making apparatus for controllably producing a beverage from a beverage making substance by combining heated water with a beverage substance, the apparatus comprising:

- a controller;
- a controllable water source;
- a water dispensing line communicating with the water source;
- a flow meter communicating with the water dispensing line and coupled to the controller for monitoring the volume of water flowing through the water dispensing line;
- a controllable heated water reservoir communicating with the water dispensing line and coupled to the controller for controllably heating water for use in making beverages;
- a spray head communicating with the heated water reservoir; and
- a volume adjustment assembly coupled to the controller for selectively adjusting the volume of water dispensed from the spray head, the volume adjustment assembly including a potentiometer coupled to the controller.

2. (original) A beverage making apparatus of claim 1, further comprising a controllable pump communicating with the water dispensing line and coupled to the controller for pumping water to the spray head.

3. (original) A beverage making apparatus of claim 1, further comprising the water source being a pressurized water line communicating with the water line for providing water to the beverage making apparatus.

4. (original) A beverage making apparatus of claim 1, further comprising the water source being a water reservoir communicating with the water line for providing water to the beverage making apparatus.

5. (original) A beverage making apparatus of claim 4, further comprising a level sensor associated with the water reservoir and communicating with the controller for detecting the level of water in the reservoir.

6 – 12 (canceled)

13. (previously presented) A beverage making apparatus for controllably producing a beverage from a beverage making substance by combining heated water with a beverage substance, the apparatus comprising:

- a beverage making substance compartment for retaining a beverage making substance;

- a controller;

- a water source;

- a water dispensing line communicating with the water source;

- a flow meter associated with the water dispensing line and coupled to the controller for providing information to the controller corresponding to a volume of water flowing through the dispensing line;

- a controllable heated water reservoir communicating water dispensing line and coupled to the controller for controllably heating water for use in making beverages;

- a spray head communicating with the heated water reservoir and to deliver water to the brewing substance compartment;

- an user operable adjustment control assembly coupled to the controller for allowing a user to selectively adjusting the volume of water dispensed to the beverage making substance compartment, the user operable adjustment control assembly including a potentiometer coupled to the controller; and

whereby the controller uses the information from the setting selected at the adjustment control assembly and monitors the information from the flow meter to facilitate dispensing of a volume of water to the beverage making substance compartment corresponding to the selection by the user at the adjustment control assembly.

14. (original) A beverage making apparatus of claim 13, further comprising a controllable pump communicating with the water dispensing line and coupled to the controller for pumping water to the spray head.
15. (original) A beverage making apparatus of claim 13, further comprising the water source being a pressurized water line communicating with the water line for providing water to the beverage making apparatus.
16. (original) A beverage making apparatus of claim 13, further comprising the water source being a water reservoir communicating with the water line for providing water to the beverage making apparatus.
17. (original) A beverage making apparatus of claim 16, further comprising a level sensor associated with the water reservoir and communicating with the controller for detecting the level of water in the reservoir.
18. – 21. (canceled)

22. (currently amended) The beverage-making apparatus of claim 19;

A beverage making apparatus for controllably producing a beverage from a beverage making substance by combining water with a beverage substance, the apparatus comprising:

a beverage making substance compartment for combining a beverage making substance with water to produce a beverage;

a controller;

a water source;

a water dispensing line communicating with the water source;

a flow control associated with the water dispensing line and coupled to the controller for controlling the flow of water to the beverage making substance compartment;

a user operable variable adjustment control assembly coupled to the controller for allowing a user to selectively set a characteristic of the beverage produced by the apparatus;

the user operable variable adjustment control assembly is coupled to a potentiometer communicating with the controller to provide a variable range of settings;

whereby the controller uses the information from the setting selected at the user operable variable adjustment control assembly and monitors the information from the flow control to facilitate dispensing of a selected volume of water to the beverage making substance compartment to produce beverage corresponding to the selection by the user at the user operable variable adjustment control assembly; and

wherein the characteristic controllable at the user operable variable adjustment control assembly corresponds to the volume of water dispensed to the beverage making substance compartment.

23. (previously presented) The beverage making apparatus of claim 22, wherein the characteristic controllable at the adjustment control assembly also corresponds to the flavor of the resultant beverage.

24. (previously presented) The beverage making apparatus of claim 22, wherein the characteristic controllable at the adjustment control assembly also corresponds to the darkness of the resultant beverage.

25. -- 26. (canceled)

27. (previously presented) The beverage making apparatus of claim 22, wherein the sliding adjustment control of the adjustment control assembly shifts generally horizontally.

28. (previously presented) The beverage making apparatus of claim 22, wherein the adjustment control assembly is also generally positioned at a base of the apparatus.

29. (previously presented) The beverage making apparatus of claim 22, wherein the adjustment control assembly is also generally positioned at a base of the apparatus proximate to a dispensing area at which a container is positioned for receipt of beverage from the apparatus.

30. (currently amended) The beverage making apparatus of claim 19;
A beverage making apparatus for controllably producing a beverage from a beverage
making substance by combining water with a beverage substance, the apparatus
comprising:

a beverage making substance compartment for combining a beverage making
substance with water to produce a beverage;

a controller;

a water source;

a water dispensing line communicating with the water source;

a flow control associated with the water dispensing line and coupled to the controller
for controlling the flow of water to the beverage making substance compartment;

a user operable variable adjustment control assembly coupled to the controller for
allowing a user to selectively set a characteristic of the beverage produced by the
apparatus, the user operable variable adjustment control assembly is coupled to a
potentiometer communicating with the controller to provide a variable range of
characteristic settings;

whereby the controller uses the information from the setting selected at the variable
adjustment control assembly and monitors the information from the flow control to
facilitate dispensing of a selected volume of water to the beverage making substance
compartment to produce beverage corresponding to the selection by the user at the
variable adjustment control assembly; and

wherein the variable adjustment control assembly includes a touch panel screen which
can be operated to select at least one of [[a]] the variable range of characteristics of the
resultant beverage.

31. (canceled)
